Hepatobiliary Interventions

The number of interventional radiology procedures for hepatobiliary disease has increased significantly over the last decade.

Ablation therapies, transarterial chemo-embolisation (TACE) and Yttrium-90 radio-embolisation (Y-90) have become well recognised procedures for treatment of both HCC and metastatic liver disease. Transjugular Intrahepatic Porto-Systemic Shunt (TIPSS) is an important treatment in patients with portal hypertension and Balloon-occluded Retrograde Transvenous Obliteration (BRTO) is being adopted from the Japanese as a treatment for gastric varices throughout the world. Percutaneous Transhepatic Cholangio Drainage (PTCD) and biliary stenting may have been partially replaced by ERCP, but are more complex in an increasing number of patients that have undergone liver transplantation or other hepatobiliary surgery.

WIRES 2010 will bring you an update on hepatobiliary interventions through presentations and hands-on. We are honoured to have Dr Arai Yasuaki, Head of Division of Diagnostic Radiology, National Cancer Center Hospital, Tokyo, Japan and Dr Riad Salem, Director of Interventional Oncology from Northwestern Memorial Hospital, Chicago USA as speakers. We look forward to your participation to WIRES 2010!
